data erasure

We offer a wide range of data erasure services guaranteeing security, compliance and flexibility.

Gold ITAD Partner

wiping

During this process all data is erased via a specialized software that ensures the complete deletion of all content in accordance with the highest security standards.

Other than with degaussing and shredding, during the wiping process only residual value remains, allowing you to get a return on investment on the equipment as it can be re-used.

shredding

Customer can choose to fully destruct hardware by choosing this additional step of shredding. Disks are physically put through an electronic shredding machine. This waste is given to certified recycling partners to dispose of in an environmentally friendly way.

degaussing

Degaussing includes the exposure of the disks to an electromagnetic pulse. By eliminating the remnant magnetic fields on the disk and thereby 'disrupting' the data stored, the data is then being forced to align with the magnetic pulse it is being exposed to. This makes the data completely unrecoverable. All data is erased from storage devices.

guaranteeing security, compliance and flexibility

+ certification of destruction provided
+ serial track and trace
+ logistic services by in-house experts
+ on-site and off-site services

In line with our Green IT policy that supports the implementation of best environmental practices when managing end-of-life hardware, we provide you with the options to recycle, buy back and/or re-use your disposed hardware.
